-!- FUNCTION: Essential for biological clock functions. Determines the period length of circadian and ultradian rhythms; an increase in period length of circadian rhythms; and a decrease leads to lengthened circadian rhythms. Besential for the circadian rhythmic and a decrease leads to lengthened circadian rhythms. Essential for the circadian rhythmic component of the male courtship song that originates in rhythmic formation and nuclear localization of the TIM-PER complex. Light induces the degradation of the TIM-PER complex. Light induces the degradation of the heterodimer coordinatively regulates PER and TIM transcription through a negative feedback loop. Behaves as a negative element in circadian transcriptional loop. Does not appear to bind DNA, suggesting indirect transcriptional limibition (By similarity).

-!- SUBUNIT: Forms heterodimer with timeless (TIM); the complex then transcroase into the nucleus (By similarity).

Outer membrane protein B precursor (168 kba surface-layer protein)
(Surface protein antigen) (Cell surface antigen 5) (Scas) (rompa)
(romp B) [Contains: 120 kba surface-exposed protein (Surface protein antigen) (120 kba outer membrane protein ompa); 32 kba beta peptide].
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     72; Gaps

STRUCTURAL PROTEIN WHITH MAY PLAY A ROLE AS A RICKETTSIAL
VIRULENCE FACTOR AND/OR IMMUNOGEN DURING INFECTION (By
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  by a S-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        similarity).
-!- FUNCTION: THE 32 kDa BETA PEPTIDE MAY SERVE AS A MEMBRANE ANCHOR [8P similarity].
-!- SUBCELLULAR LOCATION: Cell wall. This bacterium is covered by a SIASCELLULAR hexagonal symmetry (By similarity).
-!- SIMILARITY: BELONGS TO THE RICKETTSIAE OMPA/OMPB FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            P. segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use, of thin aggregative finbriae (SERI/TAR) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CsgA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the back into the chromosome of the homologous species, replacing the native
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8888888888

```
comprising separating an amino acid polymer comprising a recombinant Agfa protein containing a replacement segment or segments of foreign amino acid polymer comprising a recombinant Agfa protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or can be contained as a contained and introducing the complymer into the animal in conjunction with a carrier or diluent. (I) is useful for the expression of recombinant Agfa protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copiess/cell), the hybrid fimbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and incompanies the inserted epitope, and hybrid fimbriae are easy and incompanies the inserted epitope, and hybrid fimbriae are easy and incompanies the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                          ö

Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.

Disclosure, Page 138; 139pp; English

```
The present invention describes a recombinant agfA gene (1) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (1) use of thin aggregative finbriae (SEP1/7PR) mucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant of AgfA, CsgA and AgfA.homologue fimbrin subunits, respectively, (2) directing recombination of a recombinant gene into the chromosome of the homologues species, replacing the native copy of that gene, and (4) eliciting an immune response in an animal, copy of that gene, and (4) eliciting an immune response in an animal, copy of that gene a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (1) is useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful for system the heterologues arigines are presented in high numbers (up to 500,000 copies/Cell), the hybrid finbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live function, the numbers of mortant for directing an immune response
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 SDARKYDQLVTRVVTHEMAHA------GQGADNSTIELTQNGFRNNATIDQWNAKNSD 112

                                                                                                 The present sequence represents agfA encoded by the full agfA gene derived from Salmonella enteritidis 2765-3b. The nucleic acid can be used to provide diagnostic assays for Salmonella and/or enteropathogenic bacteria of the family Enterobacteria. It can also be used to provide proteins and antibodies which can be used for assays. The nucleic acid sequence can be used to provide proposes or primers which can specifically hybridise to nucleic acid molecules from greater than 99% of Salmonella strains that are pathogenic to warm-blooded animals relative to nucleic 25-MAR-2003 to correct PF field.)

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitepe or antigen. Also described are: (I) use of thin aggregative finbriae (SEP1/7RF) nucleation depended assembly system of strains of Salmonella. Escherichia coli and Enterposateriaceae for the production of finbriae comprising recombinant of a recombination of a recombinant of a recombinant gene into the chromosome of the homologous species, replacing the native comprising species, and (4) eliciting an immune response in an animal, we comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. Coli or acid sequence or sequences grown on a Salmonella, E. Coli or Enterobacteriaceae host cell. from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluter. (I) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the immunogens, which may be important for directing an immune response con manaled are are usually strong animal protein are are usually strong animal properties are usually strong animal properties are usually strong animal protein are passed and are presented and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are passed and are pas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 105
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 SDARKSETTITQSGYGNGADYDQLVTRVVTHEMAHA------FRNNATIDQ 105

```

Salmonella enteritidis. Escherichia coli.

Synthetic.

```
The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epicope or antigen. Also described are: (1) use of thin aggregative finbries (SEPI)/TAP) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Entertage and AgfA-homologue fimbrin submits, respectively; (2) directing recombinant of a recombinant gene into the chromosome of the homologue species; (3) directing recombinant gene into the chromosome of the homologue species; replacing the native comprising separating a manno acid polymer comprising recombinant gene copy of that gene; and (4) eliciting an immune response in an animal, comprising separating a replacement segment or segments of foreign amino acid solver comprising a replacement segment or segments of foreign amino acid segment or segments of foreign amino containing a replacement segment or segments of foreign amino containing a replacement segment or segments of foreign amino set discreting actions and introducing the polymer into the animal in conjunction with a carrier or dilutent. (I) is eliciting an immune response in an animal. In a finbrial presentation system the hererologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid finbrin protein possesses both the immunogens, which may be important for alrecting an immune response in an animal processive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                   Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDSTLSIYQYGSANAALALQ 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -----GQGADNSTIELTQNGF 97

segment of the gene has been replaced by a segment of the gene has been replaced by a segment of the gene has been replaced by a segment of the gene has been replaced by a segment of the gene has been replaced by a segment of the agreement of strains of salmonella. Then morpates of secretariates of salmonella. Becherichia coli and Buterobacteriaceae for the production of fimbriae comprising recombinant of a recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene in immorphism of the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene in immorphism of a recombinant gene on the chromosome of the homologous species; replacing the native copy of that gene; and (4) eliciting an immore response in an animal, comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino acid polymer into the animal in conjunction with a carrier or diluent. (1) is useful for the expression of recombinant AgfA protein which is useful for eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein possesses both the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          --YDQLVTRVVTHEMAHAGQGADNSTIELTQNGFR 98

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA comparison encodes a foreign epicope or antigen. Also described are: (1) use of thin aggregative finbried (SETI/TAR) nucleation depended assembly system of strains of Salmonella, Escherichia coli and context and AgfA-homologue fimbried (SETI/TAR) nucleation depended assembly system of strains of Salmonella, Escherichia coli and directing recombination of a recombination of the comprising recombinant on the chromosome of the homologue species, respectively; (2) directing recombination of a recombinant gene into the chromosome of the homologue species, resplacing the native copy of that gene, and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a replacement sequent or sequents of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or comprising separating an amino acid polymer comprising number sequence or sequences grown on a Salmonella, E. coli or context in the expression of recombinant AgfA protein which is useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful for system the heterologues antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid fimbrin protein see usually strong immunogens, which may be important for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for all empresent sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                   Salmonella; agfA; chromosomal gene replacement; fimbrin; epitope; vaccine; immune response; immunogen.

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epitope or antigen. Also described are: (I) use of thin aggregative fimbriae (SET17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and assembly system of strains of Salmonella, Escherichia coli and the construction of strains of strains of the production of fimbriae compirating recombinant Garecting recombinant gene into the chromosome of the homologous species, respectively; (2) directing recombinant gene into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA comprising separating an amino acid polymer comprising a recombinant AgfA comprising containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or and sequence or sequences grown on a Salmonella, E. coli or colymer into the animal in confidention with a carrier of diluter. (I) is useful for the expression of recombinant AgfA protein which is useful for useful for the expression of recombinant AgfA protein which is useful for system the heterologous antigens are presented in high numbers (up to 500,000 copies/cell), the hybrid finbrin protein possesses both the immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier finbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response capainst the inserted epitope, and hybrid finbriae are essually strong incurpansive to purify in large amount. The present sequence is given in

Also described are: (1) use of thin aggregative fimbriae (SEF17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterobacteriaceae for the production of fimbriae comprising recombinant AgfA, CSBA and AgfA-homologue fimbrin subunits, respectively; (2) directing recombinant gene into the chromosome of the homologous species; (3) directing recombinant gene into the chromosome of the homologous species; (3) directing recombinant of a recombinant gene.

Also described are:
Enterobacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (1) useful for the expression of recombinant AgrA protein which is useful eliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to 500,000 'copies/cell', the hybrid fimbrin protein possesses both the immunogénicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response against the inserted epitope, and hybrid fimbriae are easy and inexpensive to purify in large amount. The present sequence is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MKLLKVAAFAAIVVSGSALAGVVPQWGGGGNHNGGGNSSGPDSTLSIYQYGSANAALALQ

cc (1) use of thin aggregative fimbriae (SEF17/TAF) nucleation depended assembly system of strains of Salmonella, Escherichia coli and Enterbacteriaese for the production of fimbriae comprising recombinant of Enterbacteriaese for the production subunits, respectively, (2) directing recombination of a recombination of a recombinant gene (5) adirecting recombination of a recombinant gene (5) back into the chromosome of the homologous species, replacing the native (5) back into the chromosome of the homologous species, replacing the native (5) back into the draman and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino cof sequence or sequences grown on a Salmonella, E. coli or Enterbacteriaceae host cell, from the host cell and introducing the polymer into the animal in conjunction with a carrier or diluent. (1) is useful for the expression of recombinant AgfA protein which is useful for celliciting an immune response in an animal. In a fimbrial presentation system the heterologous antigens are presented in high numbers (up to copies/cell), the hybrid fimbrin protein see usually strong communogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial subunit proteins are usually strong immunogens, which may be important for directing an immune response cagainst the inserted epicope, and hybrid fimbriae are easy and income constitution of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA comparison encoded by a segment of the gene has been replaced by a segment of a foreign DNA comparison to the modes a foreign epitope or antigen. Also described are: (1) use of thin aggregative fimbrise (SETI/TAF) nucleation depended assembly system of strains of Salmonella. Escherichia coli and consequent of the production of fimbrise compirating recombinant consequences for the production of fimbrise compirating recombination of a recombination of a recombinant gene into the chromosome of the homologous species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a replacement segment or segments of foreign amino conteining a replacement segment or segments of foreign amino conteining a replacement segment or segments of foreign amino conteining a replacement segment or segments of foreign amino conteining a replacement segment or segments of introducing the protein conteining a replacement segment or segments of foreign amino conteining a replacement segment or segments of foreign amino conteining an immune response in an animal. In a finbrial presentation system the heterologous antigens are presented in high numbers (up to concine, the carrier finbrial submit protein possesses both the immunogens, which may be important for directing an immune response in any immune response in any immune response in any immune response in any immune response in any immune response in any immune response in any immune response in any immune response in any immune response in any immune response in any immune response in any immune response in expression of the present invention requence is given in the exemplification of the present invention present sequence is given in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 SDARKYDQLVTRVVTHEMAHAGQGADNSTIELTQNGFRNNATIDQWNAKNSDITVGQYGG 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120

```
The present invention describes a recombinant agfA gene (I) where a segment of the gene has been replaced by a segment of a foreign DNA sequence which encodes a foreign epicope or anigen. Also described are: (1) use of thin aggregative fimbries (SEPI/TAP) nucleation depended assembly system of strains of Salmonella Escherichia coli and Entertobacteriaceae for the production of fimbriae comprising recombinant of Entertobacteriaceae for the production of fimbriae comprising recombination of a recombinant gene into the chromosome of the homologue species; (3) directing recombinant gene into the chromosome of the homologue species, replacing the native copy of that gene; and (4) eliciting an immune response in an animal, comprising separating an amino acid polymer comprising a recombinant AgfA protein containing a replacement segment or segments of foreign amino acid sequence or sequences grown on a Salmonella, E. coli or Enterobacteriaceae host cell, from the host cell and introducing the coliciting an immune response in an animal. In a fimbrial presentation system the heterologus antigens are presented in high numbers (Up to 500,000 copies/cell), the hybrid fimbrin protein sare usually strong immunogenicity and adhesion properties relevant for an efficient live vaccine, the carrier fimbrial submit protein are usually strong against the inserted epitope, and hybrid fimbriae are easy and much in the exemplification of the present invention
                                                                                                                                                                                                                                     Recombinant agfA gene having a segment replaced by a foreign DNA sequence which encodes foreign epitope or antigen, expresses recombinant AgfA protein useful for eliciting immune response in animal.
                                                                                                                               Kay WW;
                                                                                                                                                                                                                                                                                                                           Disclosure; Page 135; 139pp; English.

subunit 15 kDa protein. E. coli CsgA XEXEXEX

```
The invention relates to an isolated peptide capable of binding a mammalian plasma protein or of generating an immune response in a mammal selected from sequences shown in ABREAGE4. ABREAGE48.49. The peptide or antibody is useful for treating a bacterial infection in a human or animal or in the manufacture of a medicament for the prophylactic treatment of a bacterial infection, such as Escherichia coli, Salmonella or Shigella infection. The peptide that is immobilized on a solid support is also useful as a reagent for determining the ability of a plasma protein to bind to bacteria. The present sequence represents an E. coli
                                                                                                                                                                                                                                                                                                                                        New isolated peptide capable of binding a mammalian plasma protein, useful in the manufacture of a medicament for the prevention and/or treatment of a bacterial infection, such as Escherichia coli, Salmonella or Shigella infections.
